

Master Control

Lathem

Choose the power of master controls

The Master Control series can improve attendance, organize schedules and increase efficiency. Designed for Lathem's wired wall clocks, the LTR-512 series can control virtually any type of secondary clock system. The system can be programmed, via keypad, with eight password-protected bell schedules, which may be used in combinations; each capable of executing 64 multi-function "events" (512 aggregate). These master controls can store schedules and controls from any RS232 / RS485 connected computer running Lathem's MasterLink Software, or can be accessed and diagnosed remotely, via modem (Model LTR8-512M).

Secondary Clocks

Wired Wall Clocks

Our synchronous wall clock systems have been used in schools, hospitals, airports and other large institutions that rely on accuracy from clock to clock. Remember the big black-and-white wall clock in school? It was probably made by Lathem then and it still is today. All of our wall clock systems are designed to keep your environment on schedule.
